Project Proposal

Lvov Egor

I have an app which allows me to search & play my music library. I will design two parts of it:

1) Track selection & navigation (big list with search bar)

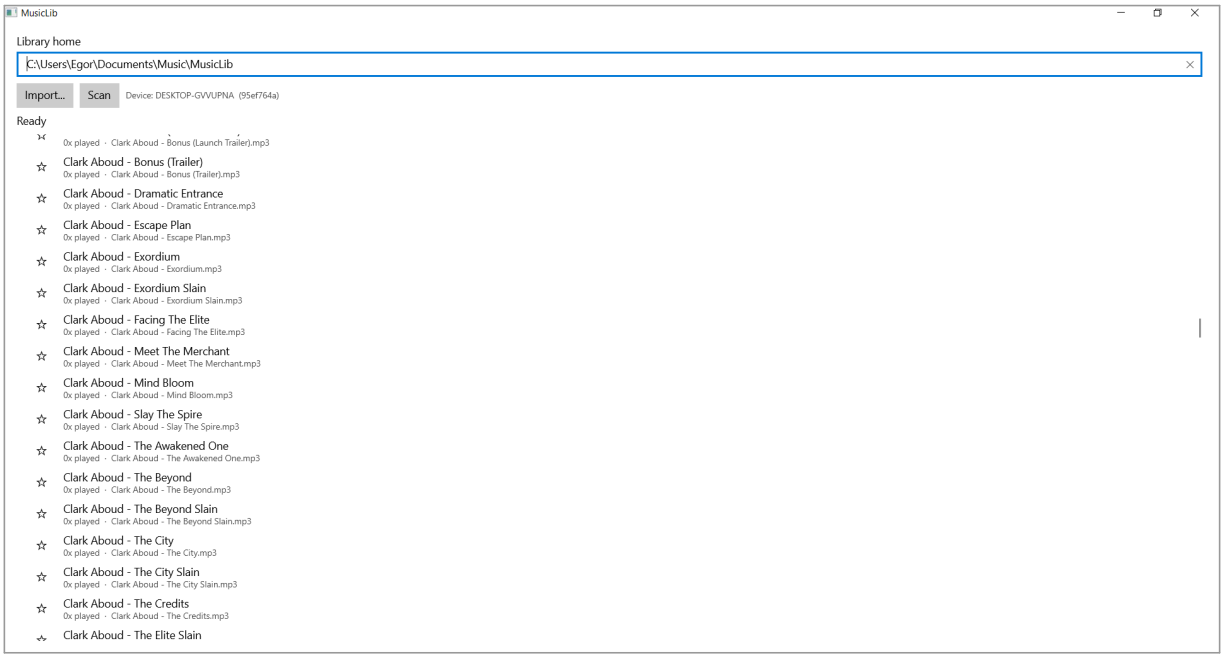

Figure 1. Current barebone design of navigator

2) Track player (see attached schematic picture I found online)

Figure 2. Current barebone design of player

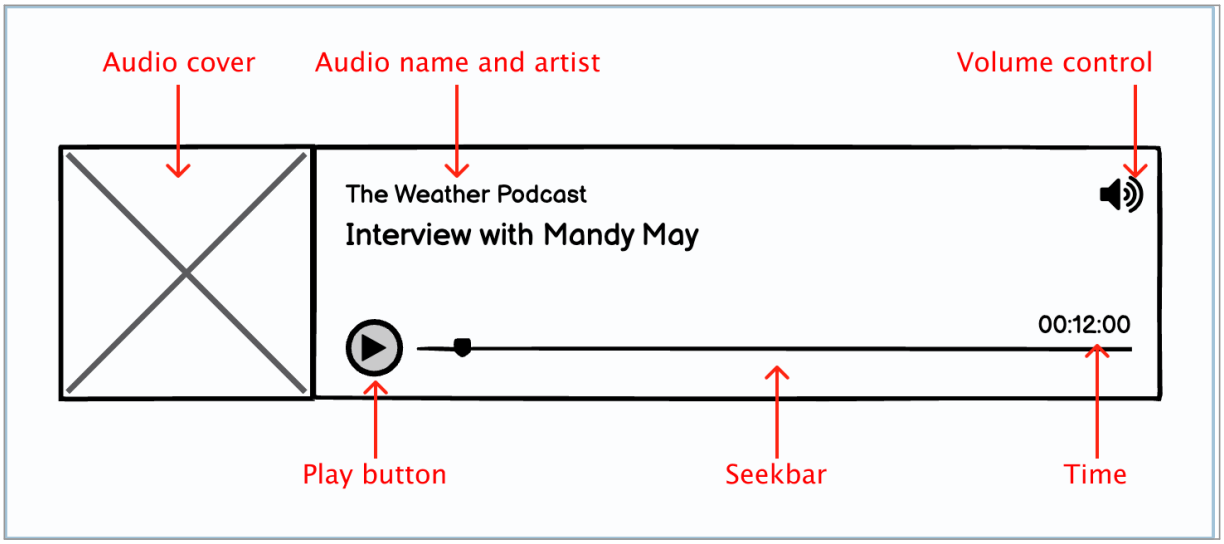

Figure 3. Schema of elements present in the player

I can present the app on my own device, give a repo link, or just allow you to download and use it (written in C#, so it supports cross-platform natively).

I will present the rationale as a written paper.
